

## **Abstract**

This given monograph titled " Visual impairment – behavioral approaches in education with aids" shows an introduction to interdisciplinary cooperation with the use of applied behavioral analysis in various activities of the individual in his/her environment and possible changes in his/her behavior in changing environment. Several groups of subjects with different visual impairment are presented in this document, correcting their own eye refractive errors and the rehabilitation process of vision using techniques that form the basis of applied behavioral analysis. This is only an introduction to the possibilities for visually impaired clients to work and train with individual types of optical correction aids, thus their visually impaired functions often increase significantly, thereby enhancing individuals and enabling them to integrate into ordinary life. By strengthening individuality we will achieve their better social application and acceptance.
